AMENDMENTS TO THE CLAIMS

Please amend the claims as indicated hereafter. [Use strikethrough for deleted matter and <u>underlined</u> for added matter.]

1.-6. (Canceled)

7. (Currently Amended) The method of claim 6, wherein the step of determining whether the one or more logical volume groups conform to a predetermined logical volume management condition comprises A method for providing automated diagnostic services for a cluster computer system comprising a plurality of nodes, each of the plurality of nodes providing an application to a plurality of clients, the method comprising:

receiving information related to a plurality of drives associated with the plurality of nodes in the cluster computer system, the drives defining one or more logical volume groups;

determining whether the drives conform to a predefined condition related to failover capability based on the information related to the drives, such that the one or more logical volume groups transition in the event of a failover;

determining whether the one or more logical volume groups conform to a predetermined logical volume management condition;

determining whether the logical volume numbers within the one or more logical volume groups are numbered sequentially; and

providing a warning if the drives do not conform to the predefined condition;

8. (Currently Amended) The method of claim 1, further comprising the steps A method for providing automated diagnostic services for a cluster computer system comprising a plurality of nodes, each of the plurality of nodes providing an application to a plurality of clients, the method comprising the steps of:

receiving information related to a plurality of drives associated with the plurality of nodes in the cluster computer system, the drives defining one or more logical volume groups;

determining which of the plurality of drives are shared drives;

initiating a read/write test on the shared drives;

determining whether the drives conform to a predefined condition related to failover capability based on the information related to the drives, such that the one or more logical volume groups transition in the event of a failover; and

providing a warning if the drives do not conform to the predefined condition.

9. (Original) The method of claim 8, wherein the step of initiating a read/write

test involves a nondestructively bounded pseudo random read/write test.

10. (Original) The method of claim 8, further comprising the step of providing a

warning if one of the shared drives fails the read/write test.

11. (Original) The method of claim 10, further comprising the step of determining

whether each of the plurality of nodes in the cluster computer system can access the shared

drives.

12. (Original) The method of claim 11, further comprising the step of providing a

warning if one of the plurality of nodes in the cluster computer system cannot access one of

the shared drives.

13.-19. (Canceled)

20. (Currently Amended) The computer program of claim-19, A computer

program for providing automated diagnostic services for a cluster computer system

comprising a plurality of nodes, each of the plurality of nodes providing an application to a

plurality of clients, the computer program, stored on a computer readable storage medium and

executing in a computer, comprising:

a first portion of logic configured to receive information related to a plurality of drives

associated with the plurality of nodes in the cluster computer system, the drives defining one

or more logical volume groups;

a second portion of logic configured to determine, based on the information related to

the drives, whether the drives conform to a predefined condition related to failover capability

such that the one or more logical volume groups transition in the event of a failover, and

configured to determine whether the one or more logical volume groups conform to a

predetermined logical volume management condition, and wherein the second portion of

logic is further configured to determine whether the logical volume numbers within the one or

more logical volume groups are numbered sequentially; and

-5-

a third portion of logic configured to provide a warning if the drives do not conform to the predefined condition

21. (Currently Amended) The computer program of claim 13, further comprising, A computer program for providing automated diagnostic services for a cluster computer system comprising a plurality of nodes, each of the plurality of nodes providing an application to a plurality of clients, the computer program, stored on a computer readable storage medium and executing in a computer, comprising:

a first portion of logic configured to receive information related to a plurality of drives associated with the plurality of nodes in the cluster computer system, the drives defining one or more logical volume groups;

a second portion of logic configured to determine, based on the information related to the drives, whether the drives conform to a predefined condition related to failover capability such that the one or more logical volume groups transition in the event of a failover;

a third portion of logic configured to provide a warning if the drives do not conform to the predefined condition;

- a fourth portion of logic configured to determine which of the plurality of drives are shared drives; and
 - a fifth portion of logic configured to initiate a read/write test on the shared drives.
- 22. (Original) The computer program of claim 21, wherein the read/write test is a nondestructively bounded pseudo random read/write test.
- 23. (Original) The computer program of claim 21, further comprising a sixth portion of logic configured to provide a warning if one of the shared drives fails the read/write test.
- 24. (Original) The computer program of claim 23, further comprising a seventh portion of logic configured to determine whether each of the plurality of nodes in the cluster computer system can access the shared drives.

25. (Original) The computer program of claim 24, further comprising an eighth portion of logic configured to provide a warning if one of the plurality of nodes in the cluster computer system cannot access one of the shared drives.

26. (Canceled)

27. (Currently Amended) The system of claim 26, further comprising A system for providing automated diagnostic services for a cluster computer system comprising a plurality of nodes, each of the plurality of nodes providing an application to a plurality of clients, the system comprising:

means for receiving information related to a plurality of drives associated with the plurality of nodes in the cluster computer system, the drives defining one or more logical volume groups;

means for determining which of the plurality of drives are shared drives;

means for initiating a read/write test on the shared drives;

means for determining, based on the information related to the drives, whether the drives conform to a predefined condition related to failover capability such that the one or more logical volume groups transition in the event of a failover; and

means for providing a warning if the drives do not conform to the predefined condition.

- 28. (Original) The system of claim 27, wherein the read/write test involves a nondestructively bounded pseudo random read/write test.
- 29. (Original) The system of claim 27, further comprising a means for providing a warning if one of the shared drives fails the read/write test.
- 30. (Original) The system of claim 29, further comprising a means for determining whether each of the plurality of nodes in the cluster computer system can access the shared drives.

31. (Original) The system of claim 30, further comprising a means for providing a warning if one of the plurality of nodes in the cluster computer system cannot access one of the shared drives.

32.-40. (Canceled)

41. (Currently Amended) The system of claim 32, wherein the logic is further eonfigured to A system for providing automated diagnostic services for a cluster computer system, the system comprising a computer having logic configured to:

receive information related to a plurality of drives associated with a plurality of nodes in the cluster computer system, the drives defining one or more logical volume groups;

determine, based on the information related to the drives, whether the drives conform to a predefined condition related to failover capability such that the one or more logical volume groups transition in the event of a failover;

determine whether the logical volume numbers within the one or more logical volume groups are numbered sequentially; and

provide a warning if the drives do not conform to the predefined condition.

42. (Currently Amended) The system of claim 32, wherein the logic is further configured to A system for providing automated diagnostic services for a cluster computer system, the system comprising a computer having logic configured to:

receive information related to a plurality of drives associated with a plurality of nodes in the cluster computer system, the drives defining one or more logical volume groups;

determine which of the plurality of drives are shared drives; and initiate a read/write test on the shared drives;

determine, based on the information related to the drives, whether the drives conform to a predefined condition related to failover capability such that the one or more logical volume groups transition in the event of a failover; and

provide a warning if the drives do not conform to the predefined condition.

43. (Original) The system of claim 42, wherein the logic is configured to provide a warning if one of the shared drives fails the read/write test.

44. (Original) The system of claim 43, wherein the logic is further configured to determine whether each of the plurality of nodes in the cluster computer system can access the shared drives.

- 45. (Original) The system of claim 44, wherein the logic is further configured to provide a warning if one of the plurality of nodes in the cluster computer system cannot access one of the shared drives.
- 46. (New) The method of claim 7, wherein receiving information related to a plurality of drives and the step of providing a warning are via a communications network.
- 47. (New) The method of claim 7, wherein receiving information related to a plurality of drives and the step of providing a warning are performed within the cluster computer system.
- 48. (New) The method of claim 7, wherein determining whether the drives conform to a predefined condition comprises determining whether the drives are unique.
- 49. (New) The method of claim 7, wherein determining whether the drives conform to a predefined condition comprises determining whether a plurality of drive paths are valid.
- 50. (New) The method of claim 8, wherein the step of receiving information related to a plurality of drives and the step of providing a warning are via a communications network.
- 51. (New) The method of claim 8, wherein the step of receiving information related to a plurality of drives and the step of providing a warning are performed within the cluster computer system.
- 52. (New) The method of claim 8, wherein the step of determining whether the drives conform to a predefined condition comprises determining whether the drives are unique.

53. (New) The method of claim 8, wherein the step of determining whether the

drives conform to a predefined condition comprises determining whether a plurality of drive

paths are valid.

54. (New) The computer program of claim 20, wherein the first portion of logic is

further configured receive the information related to a plurality of drives via a

communications network and the third portion of logic is further configured to provide the

warning via the communications network.

55. (New) The computer program of claim 20, wherein the first, second, and third

portions of logic are embodied in cluster middleware controlling the cluster computer system.

56. (New) The computer program of claim 20, wherein the first, second, and third

portions of logic are embodied in an operating system associated with each of the plurality of

nodes.

57. (New) The computer program of claim 20, wherein the second portion of

logic is further configured determine whether the drives are unique.

58. (New) The computer program of claim 20, wherein the second portion of

logic is further configured to determine whether a plurality of drive paths are valid.

59. (New) The computer program of claim 21, wherein the first portion of logic is

further configured receive the information related to a plurality of drives via a

communications network and the third portion of logic is further configured to provide the

warning via the communications network.

60. (New) The computer program of claim 21, wherein the first, second, and third

portions of logic are embodied in cluster middleware controlling the cluster computer system.

-10-

61. (New) The computer program of claim 21, wherein the first, second, and third portions of logic are embodied in an operating system associated with each of the plurality of nodes.

- 62. (New) The computer program of claim 21, wherein the second portion of logic is further configured determine whether the drives are unique.
- 63. (New) The computer program of claim 21, wherein the second portion of logic is further configured to determine whether a plurality of drive paths are valid.
 - 64. (New) The system of claim 41, wherein the computer is a server.
- 65. (New) The system of claim 41, wherein the logic is embodied in an operating system associated with the computer.
- 66. (New) The system of claim 41, wherein the logic is embodied in cluster middleware associated with the computer.
- 67. (New) The system of claim 41, wherein the computer further comprises a network interface card configured to communicate with a cluster interface.
- 68. (New) The system of claim 67, further comprising one or more clients in communication with the one or more computers via the cluster interface.
- 69. (New) The system of claim 41, wherein the computer further comprises a network interface configured to communicate with the cluster computer system via a communications network and wherein the information related to a plurality of drives is received via the communications network and the warning is provided to the cluster computer system via the communications network.
- 70. (New) The system of claim 41, wherein the logic is further configured to determine whether a plurality of drive paths are valid.

71. (New) The system of claim 41, wherein the logic is further configured to determine whether the one or more logical volume groups conform to a predetermined logical volume management condition.

- 72. (New) The system of claim 42, wherein the computer is a server.
- 73. (New) The system of claim 42, wherein the logic is embodied in an operating system associated with the computer.
- 74. (New) The system of claim 42, wherein the logic is embodied in cluster middleware associated with the computer.
- 75. (New) The system of claim 42, wherein the computer further comprises a network interface card configured to communicate with a cluster interface.
- 76. (New) The system of claim 75, further comprising one or more clients in communication with the one or more computers via the cluster interface.
- 77. (New) The system of claim 42, wherein the computer further comprises a network interface configured to communicate with the cluster computer system via a communications network and wherein the information related to a plurality of drives is received via the communications network and the warning is provided to the cluster computer system via the communications network.
- 78. (New) The system of claim 42, wherein the logic is further configured to determine whether a plurality of drive paths are valid.
- 79. (New) The system of claim 42, wherein the logic is further configured to determine whether the one or more logical volume groups conform to a predetermined logical volume management condition.
- 80. (New) A method for volume management services for logical volume groups of a cluster computer system, the method comprising:

determining which of the plurality of drives are shared drives;

initiating a read/write test on the shared drives;

receiving information related to a plurality of shared drives associated with a plurality of nodes in the cluster computer system, the shared drives defined by one of the logical volume groups;

determining whether the shared drives conform to a predefined condition related to failover capability; and

providing a warning if the shared drives do not conform to the predefined condition.

- 81. (New) The method of claim 80, further comprising transitioning the shared drive failing to conform to the predefined condition to another logical group.
- 82. (New) The method of claim 81, wherein the transitioning occurs in the event of a failover.
